# Free-floating Car-Sharing Mode Choice Model based on Simulated Non-Chosen Alternatives

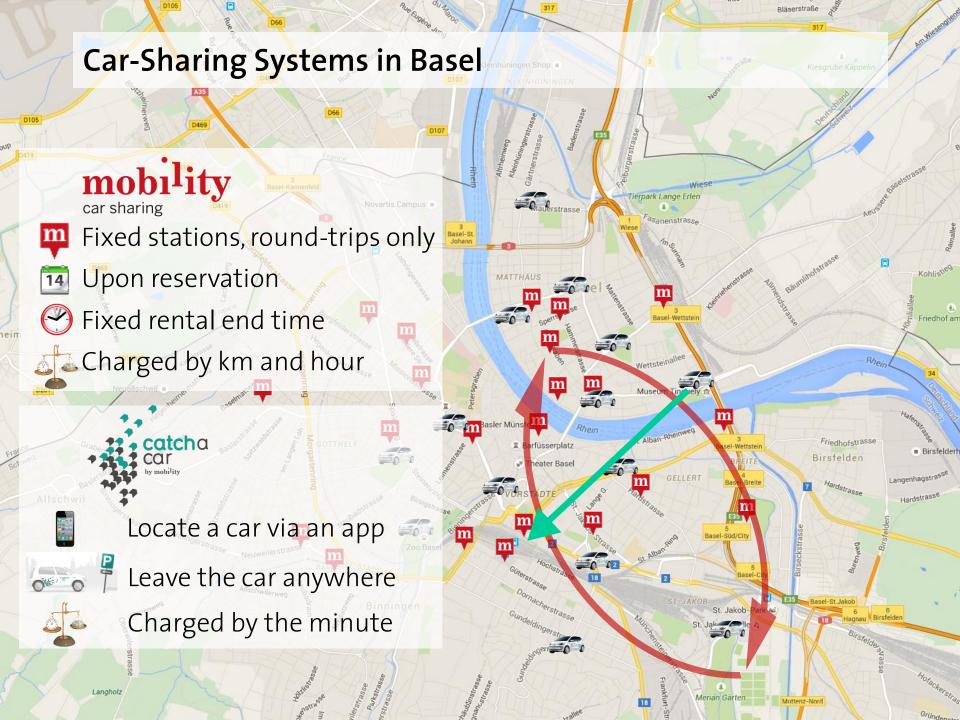

H. Becker

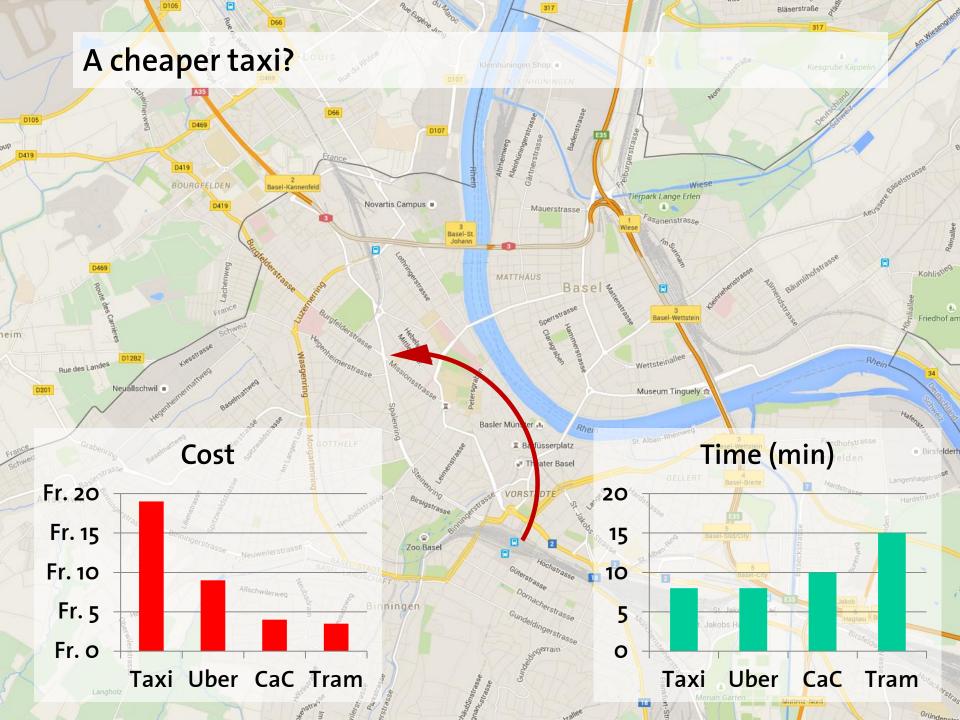

Discrete Choice Modelling Workshop Lausanne, April 2016

Eidgenössische Technische Hochschule Zürich Swiss Federal Institute of Technology Zurich

• Understand, in which situations people use free-floating car-sharing.

Applications:

- System optimization
- Agent-based simulations (e.g. MATSim)
- ...

## Mobility Study

## **Booking Data**

## **Mobility Study**

- Provided by the operator for three 3-months periods between October 2014 and March 2016
- Booking Data
  - Reservation start and end time
  - including anonymized User-ID

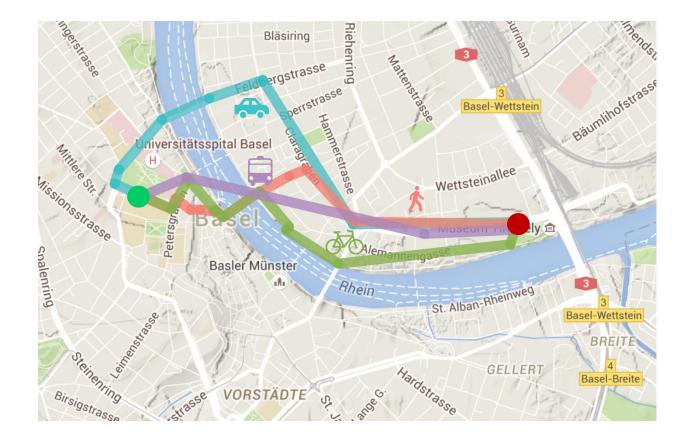

- Insurance Data
  - single trips: start- and end coordinates, travel time, distance
  - no information about user or reservation number
- Common identifyer: license plate

- Only considering trips with
  - Walk
  - Bike
  - Transit
  - Free-floating car-sharing
- Only considering one-stage trips
- Data contains only chosen alternatives.

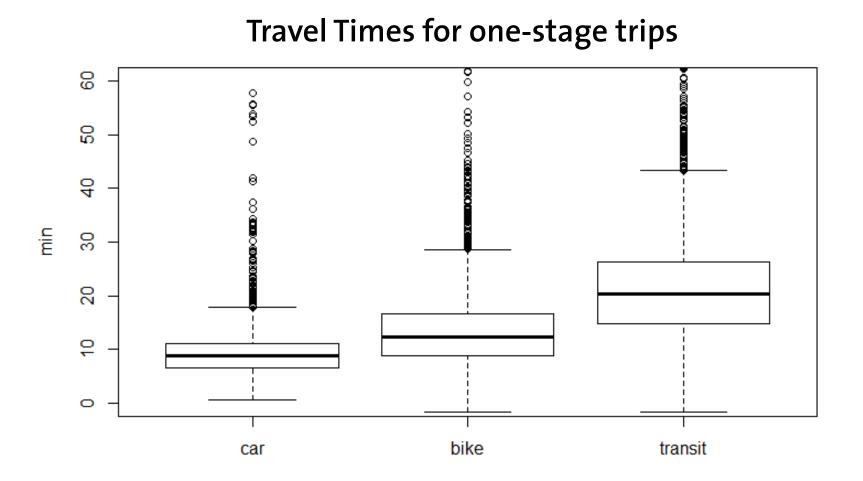

### **Generate Non-Chosen Alternatives**

- Enrich data with non-chosen alternatives using Google Maps API
- Generate car, walk, bike and transit routes for each OD pair
- Get travel time, distance, transfers, headway, elevation, ...

#### **Main Issues**

- For the booking data, the start point of the ride is not neccessarily also the start point of the trip -> how to model access?
- Many of the car-sharers hold a season-ticket or GA. How to model the marginal cost of each trip for them?
- Parking search is not included in the routed car-trips.

## **Modelling Approach**

• Use alternative-specific conditional logit model

$$\mathbf{X}_{i}^{*} = (\mathbf{X}_{i}, \ \mathbf{z}_{i} \otimes \mathbf{I}_{J})$$
 $oldsymbol{eta}^{*} = egin{pmatrix} oldsymbol{eta} \ \mathrm{vec}(\mathbf{A}') \end{pmatrix}$ 

• Cluster error terms by respondent

#### «Intermediate» Results

| Alternative-specific conditional logit<br>Case variable: id | Number of obs =<br>Number of cases =   | 38,260<br>9565   |
|---|--|------------------|
| Alternative variable: mode                                  | Alts per case: min =<br>avg =<br>max = | 4<br>4.0<br>4    |
| Log pseudolikelihood = -8508.8177                           | Wald chi2(11) =<br>Prob > chi2 =       | 381.58<br>0.0000 |

(Std. Err. adjusted for 901 clusters in pers\_id)

- Include the full data set in the analysis.
- Include geographical information
  - Public transportation service level
  - Population density
  - Income Levels
  - ...
- Try GMNL model approach. [Fiebig et al., 2009]
