What is a Vehicle Sharing System (VSS)?

A VSS enables users to use the available vehicles generally for short period of time by an RFID card or smart phone application identification.

Various system configurations

- One-way or return trip
- Station-based or free-floating
- Rebalancing with operators or trucks
- Dynamic or fixed pricing
- ...

Car-sharing companies

Imbalance in the network

- Bicycle-sharing systems (BSSs)
 - Vehicle routing problem (VRP) (Ghosh et al., 2016 & Liu et al., 2016)
 - Capacitated traveling salesman problem (TSP) (*Pal and Zhang et al., 2017*)
- Car-sharing systems (CSSs)
 - Multi-TSP (Nourinejad et al., 2015)
 - Mixed Integer Linear Programming (MILP) models (*Boyaci et al., 2017*)
 - Importance of the relation between demand forecasting and rebalancing (*Jorge and Correia, 2013*)
 - Denial of the requests in the case of high demand (Boyaci et al., 2017)

イロト イポト イヨト イヨト 二日

Demand estimation

BSSs

- Machine learning algorithms (Liu et al., 2016)
- Simulating the demand with a Poisson process (Ghosh et al., 2016)
- Worst-case demand (Ghosh et al., 2016)
- CSSs
 - AutoRegressive Integrated Moving Average (ARIMA) (*Müller and Bogenberger, 2015*)
 - Holt-Winter's method (Müller and Bogenberger, 2015)

(B)

Pricing

BSSs

- Prices are assigned dynamically independently of their origin or depending on the itinerary of the customer. (*Chemla et al., 2013, Waserhole, 2013*)
- Dynamic pricing improved the level of service for the weekends. (*Pfrommer et al., 2014*)
- CSSs
 - Incentives on pricing which encourages users to do trips which reduces the imbalance of the network. (*Jorge and Correia, 2013*)
 - Balance of the system is improved, but less demand is served. (*Jorge and Correia, 2013*)

Big picture

• Shared mobility systems: an updated survey by Laporte et al., (2018)

- Two dimensional classification
 - Type of the problem
 - Decision level
- Lack of research in some specific areas
 - Pricing incentives and routing problems at the strategic level
 - Locating stations in the tactical level
- This work aims to provide a holistic solution approach for the VSSs.
 - From decision maker point of view
 - Three dimensional classification
 - Actors: Supply and Demand
 - Layers: Data, Models, and Actions
 - Decision levels: Strategic, Tactical, and Operational
 - Relations between the components

< □ > < 同 > < 回 > < 回 > < 回 >

A decision level

• A first look to the general framework

3

Strategic level

- Corresponds to long-term decisions
 - What kind of system are we dealing with?
 - How is the scope defined?
- Planning horizon
 - More than a year

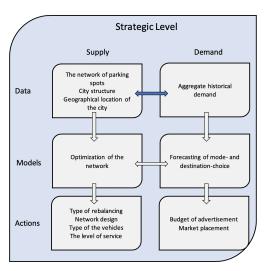

Figure: General framework - strategic level

SA,NO,MB (TRANSP-OR/EPFL)

German OR days '19

September 4, 2019 11 / 25

Tactical level

- Corresponds to mid-term decisions
 - How do we utilize the strategic level decisions?
 - Which decisions should we pass to the operational level?
- Planning horizon
 - 4-6 months

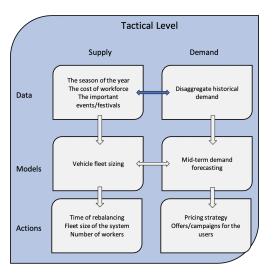

Figure: General framework -- tactical level

SA,NO,MB (TRANSP-OR/EPFL)

German OR days '19

September 4, 2019 12 / 25

Operational level

- Corresponds to short-term decisions
 - What is the current situation of the system?
 - What do we do next time step?
- Planning horizon
 - Daily/hourly

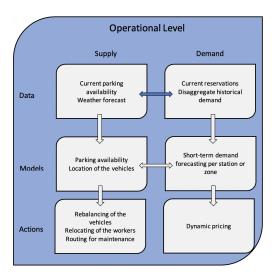

Figure: General framework - operational level

3

Big picture - revisited

- The literature consists works on BSSs and CSSs.
- New types of vehicles are being introduced in VSSs.
- Some of the approaches became inapplicable for the new types of vehicles.

• Demand forecasting component is quite promising. We will continue to analyze the added value of constructing a disaggregate demand model.

The idea

- A discrete event simulation is developed to imitate the system throughout the day.
- The vehicle distribution at the end of the day is obtained from the simulation and passed to the optimization model.
- The mathematical model solves the rebalancing problem given a desired initial state.
- Two cases are investigated
 - Demand known: this case assumes that the model knows everything for the next day perfectly. The rebalancing is done according to this information.
 - Demand unknown: this case rebalances the system to the same initial state every day.
- The main idea is to compare the number of lost demand between the two cases.

3

16/25

- 4 回 ト 4 回 ト

Simulation

- Station-based configuration is assumed.
- Reservations are not possible.

Event	Triggered Event	Queue
Sim Start	REQUEST, Sim End	-
REQUEST	REQUEST (if $t < T$),	ns = ns + 1
	PICKUP (if an available station is in 20 min walk)	-
PICKUP	DROPOFF (if there are available vehicles)	nu = nu + 1
DROPOFF	DROPOFF (if no parking available),	-
	COMPLETED	nu = nu - 1
COMPLETED		ns = ns - 1
Sim End		-

Conclusion and future work

- A general framework for VSSs is presented.
- Inter- and intra-relations between framework components are discussed.
- We focused on the evaluation of value of demand modeling and presented preliminary results.

- Different scenarios such as in the case of events will be evaluated.
- Different configurations of VSSs will be analyzed.
- An application will be done on newly introduced LEVs.
