# Continuous Pricing with Advanced Discrete Choice Demand Modeling: A Spatial Branch and Benders Decomposition Algorithm 

Tom Haering Michel Bierlaire

Transport and Mobility Laboratory
School of Architecture, Civil and Environmental Engineering Ecole Polytechnique Fédérale de Lausanne

19th Swiss Operations Research Days, Lugano 22-23 June 2023

## Outline

(1) Introduction

## (2) Methodology

(3) Experimental Results
(4) Conclusions

## EPFL

## The Continuous Pricing Problem (CPP)

## CPP

- Supplier offers $S$ products for sale. Goal: determine optimal price for each product to maximize total profit.
- Demand for each product is modeled using a discrete choice model (DCM).

DCM

- For every costumer $n$ and product $i$ a stochastic utility $U_{i n}$ is defined, which depends on socio-economic characteristics of the individual and attributes of the products (e.g. the price).

## The Continuous Pricing Problem (CPP)

Utility

- Utility of alternative $i$ for costumer $n$ :

$$
U_{i n}=\sum_{k \neq p} \beta_{k} x_{i n k}+\beta_{p} p_{i}+\varepsilon_{i n}
$$

- $\beta_{k}$ : parameters (exogenous)
- $x_{i n k}$ : attributes (exogenous)
- $p_{i}$ : price of alternative $i$
- $\varepsilon_{i n}$ : stochastic error term

## EPFL

## The Continuous Pricing Problem (CPP)

Probability

- Probability that costumer $n$ chooses alternative $i$ :

$$
P_{n}(i)=\mathbb{P}\left(U_{i n} \geq U_{j n} \forall j \in J\right)
$$

- Logit $\left(\varepsilon_{i n} \sim\right.$ i.i.d. $\left.\operatorname{Gumbel}(0,1)\right)$ :

$$
P_{n}(i)=\frac{e^{V_{i n}}}{\sum_{j \in C_{n}} e^{V_{j n}}}
$$

- Mixed Logit (Logit $+\beta_{k} \sim F\left(\beta_{k} \mid \theta\right)$ ):

$$
P_{n}(i)=\int \frac{e^{V_{i n}\left(\beta_{k n}\right)}}{\sum_{j \in C_{n}} e^{V_{j n}\left(\beta_{k n}\right)}} f\left(\beta_{k} \mid \theta\right) d \beta_{k}
$$

## Monte Carlo Simulation

- Simulate $R$ scenarios (draws), each with deterministic utilities $U_{\text {inr }}$ :

$$
U_{i n r}=\sum_{k \neq p} \beta_{k} x_{i n k}+\beta_{p} p_{i}+\varepsilon_{i n r}
$$

- Choice variables:

$$
\omega_{i n r}=\left\{\begin{array}{l}
1 \text { if } U_{i n r}=\max _{j} U_{j n r} \\
0 \text { else }
\end{array}\right.
$$

- Probability estimator:

$$
\widehat{P}_{n}(i)=\frac{1}{R} \sum_{r} \omega_{i n r}
$$

EPFL

## MILP formulation [Paneque et al., 2021]

$\max _{p, \omega, U, H} \frac{1}{R} \sum_{r} \sum_{n} \sum_{i \in S} p_{i} \omega_{i n r}$
s.t.

$$
\begin{array}{rlrl}
\sum_{i} \omega_{i n r} & =1 & \forall n, r & \left(\mu_{n r}\right) \\
H_{n r} & =\sum_{i} U_{i n r} \omega_{i n r} & \forall n, r & \left(\zeta_{n r}\right) \\
H_{n r} & \geq U_{i n r} & \forall i, n, r & \left(\alpha_{i n r}\right) \\
U_{i n r} & =\sum_{k \neq p} \beta_{k} x_{i n k}+\beta_{p} p_{i}+\varepsilon_{i n r} & \forall i, n, r & \left(\kappa_{i n r}\right) \\
\omega & \in\{0,1\}^{J N R} & & \\
p, U, H & \in \mathbb{R}^{S}, \mathbb{R}^{J N R}, \mathbb{R}^{N R} &
\end{array}
$$

## Literature

[Li and Huh, 2011], [Gallego and Wang, 2014], ...

- Extensive research for Logit and Nested Logit (NL) integration.
[Li et al., 2019], [Marandi and Lurkin, 2020],
[van de Geer and den Boer, 2022], ...
- Tackled Mixed Logit (ML) integration in various ways, e.g. approximations, assuming consumer homogeneity, or considering only discrete probability measures.
[Paneque et al., 2022]
- Apply a Lagrangian decomposition scheme to speed up the solution of the MILP.
- Limited success.

## Outline

## (1) Introduction

## (2) Methodology

(3) Experimental Results
(4) Conclusions

## EPFL

## QCQP formulation

$\max _{p, \omega, U, H} \frac{1}{R} \sum_{r} \sum_{n} \sum_{i \in S} p_{i} \omega_{i n r}$
s.t.

$$
\begin{array}{rlrl}
\sum_{i} \omega_{i n r} & =1 & \forall n, r & \left(\mu_{n r}\right) \\
H_{n r} & =\sum_{i} U_{i n r} \omega_{i n r} & \forall n, r & \left(\zeta_{n r}\right)  \tag{nr}\\
H_{n r} & \geq U_{i n r} & \forall i, n, r & \left(\alpha_{i n r}\right) \\
U_{i n r} & =\sum_{k \neq p} \beta_{k} x_{i n k}+\beta_{p} p_{i}+\varepsilon_{i n r} & \forall i, n, r & \left(\kappa_{i n r}\right) \\
\omega & \in[0,1]^{J N R} & & \\
p, U, H & \in \mathbb{R}^{S}, \mathbb{R}^{J N R}, \mathbb{R}^{N R} &
\end{array}
$$

## QCLP formulation

$\max _{p, \omega, \eta, U, H} \frac{1}{R} \sum_{r} \sum_{n} \sum_{i \in S} \eta_{i n r}$
s.t. $\sum_{i} \omega_{i n r}=1$

$$
\begin{aligned}
H_{n r} & =\sum_{i}\left(\sum_{k \neq p} \beta_{k} x_{i n k}+\varepsilon_{i n r}\right) \omega_{i n r}+\beta_{p} \eta_{i n r} & \forall n, r & \left(\zeta_{n r}\right) \\
H_{n r} & \geq U_{i n r} & \forall i, n, r & \left(\alpha_{i n r}\right) \\
U_{i n r} & =\sum_{k \neq p} \beta_{k} x_{i n k}+\beta_{p} p_{i}+\varepsilon_{i n r} & \forall i, n, r & \left(\kappa_{i n r}\right) \\
& & & \\
\eta_{i n r} & =p_{i} \omega_{i n r} & \forall i \in S, n, r & \left(\lambda_{i n r}\right)
\end{aligned}
$$

$$
\omega \in[0,1]^{J N R}
$$

$p, \eta, U, H \quad \in \quad \mathbb{R}^{S}, \mathbb{R}^{S N R}, \mathbb{R}^{J N R}, \mathbb{R}^{N R}$

## Simplification

- Assume reasonable bounds on price, $p_{i} \in\left[p_{i}^{L}, p_{i}^{U}\right]$. This means some choices are fixed.

## Simplification

Observations

- The number of controlled prices is generally low (usually, one or two).
- There are $2^{J}$ combinations of lower and upper bounds.

Procedure for each $n$ and $r$

- For each combination, identify the best alternative.
- If alternative $i$ is never the best, set $w_{i n r}=0$.
- If alternative $i$ is always the best, set $w_{i n r}=1$.

## Note

This happens often when bounds are tight.

## Spatial Branch \& Bound (B\&B) Algorithm

## Relaxation

- Relax the constraint $\eta_{i n r}=p_{i} \omega_{i n r}$ with a McCormick envelope:

$$
\begin{array}{llll}
\eta_{i n r} & \geq p_{i}^{L} \omega_{i n r} & \forall i \in S, n, r & \left(\lambda_{i n r}^{1}\right) \\
\eta_{i n r} & \geq p_{i}^{U} \omega_{i n r}+p_{i}-p_{i}^{U} & \forall i \in S, n, r & \left(\lambda_{i n r}^{2}\right) \\
\eta_{i n r} & \leq p_{i}^{L} \omega_{i n r}+p_{i}-p_{i}^{L} & \forall i \in S, n, r & \left(\lambda_{i n r}^{3}\right) \\
\eta_{i n r} \leq p_{i}^{U} \omega_{i n r} & \forall i \in S, n, r & \left(\lambda_{i n r}^{4}\right)
\end{array}
$$

- Integrality is preserved for tight enough bounds.

## Break points

Competing with opt-out: utility

EPFL

## Break points

Competing with opt-out: revenue

EPFL

## Break points

Competing with opt-out: valid inequality

EPFL

## Valid inequalities based on break points

Competing with opt-out

$$
\eta_{i n r} \leq \frac{\bar{p}_{i}\left(p_{i}^{U}-p_{i}\right)}{p_{i}^{U}-\bar{p}_{i}}
$$

Competing with another controlled alternative

$$
\eta_{i n r} \leq \frac{\beta_{j} p_{i}^{U} p_{j}-c_{i} p_{i}^{U}+c_{j} p_{i}^{U}-p_{i}\left(\beta_{j} p_{j}^{L}-c_{i}+c_{j}\right)}{\beta_{i} p_{i}^{U}-\beta_{j} p_{j}^{L}+c_{i}-c_{j}}
$$

and

$$
\eta_{i n r} \leq \frac{\beta_{j} p_{i}^{U} p_{j}-c_{i} p_{i}^{U}+c_{j} p_{i}^{U}-p_{i}\left(\beta_{j} p_{j}^{U}-c_{i}+c_{j}\right)}{\beta_{i} p_{i}^{U}-\beta_{j} p_{j}^{U}+c_{i}-c_{j}}
$$

## Spatial Branch \& Bound (B\&B) Algorithm

Convergence

- Every relaxation provides an upper bound on the maximal profit.
- Any solution value for the price gives an immediate feasible solution (lower bound) due to integrality.

## Custom $B \& B$ vs. standard $B \& B$

- We only branch on $S$ continuous variables, instead of branching on SNR continuous (QCLP) or JNR binary (MILP) variables.

## Benders Decomposition

- The McCormick relaxation (linear program) at each node is solved by the use of a Benders decomposition:

## Benders Decomposition

- Master problem (MP): compute candidate solutions for the price
- Subproblem (SP): given a price, compute reduced costs to construct optimality cut to add to the MP
- SP is highly separable: utility maximization for each customer and scenario can be solved independently
- Make use of fully disaggregated optimality cuts (one cut per customer and scenario)
- Can add valid inequalities in the Master problem.

## Outline

## (1) Introduction

## (2) Methodology

(3) Experimental Results

EPFL

## Case Study

Parking space operator [lbeas et al., 2014]

- Alternatives: Paid-Street-Parking (PSP), Paid-Underground-Parking (PUP) and Free-Street-Parking (FSP).
- Optimize prices for PSP and PUP, FSP is the opt-out alternative.
- Socio-economic characteristics: trip origin, vehicle age, driver income, residence area.
- Product attributes: access time to parking, access time to destination, and parking fee (price).
- Choice model is a Mixed Logit, $\beta_{\text {fee }}, \beta_{\text {time_parking }} \sim \mathcal{N}(\mu, \sigma)$.

TRANSP-OR

## EPFL

## Conclusions

- Introduced more efficient formulation of the CPP as a QCQP and QCLP.
- Developed methodology that is applicable to any choice-based optimization problem integrating any advanced discrete choice model.
- Showed that we can solve instances to optimality before GUROBI finds a first feasible solution.

## Thank you for your attention!

## Appendix

Table 1: Utility parameters reported in [lbeas et al., 2014]

| Parameter | Value |
| :--- | ---: |
| ASC $_{\text {FSP }}$ | 0.0 |
| ASC $_{\text {PSP }}$ | 32.0 |
| ASC | 34.0 |
| Fee $(€)$ | $\sim \mathcal{N}(-32.328,14.168)$ |
| Fee PSP - low income $(€)$ | -10.995 |
| Fee PUP - low income $(€)$ | -13.729 |
| Fee PSP - resident $(€)$ | -11.440 |
| Fee PUP - resident $(€)$ | -10.668 |
| Access time to parking $(\min )$ | $\sim \mathcal{N}(-0.788,1.06)$ |
| Access time to destination $(\min )$ | -0.612 |
| Age of vehicle $(1 / 0)$ | 4.037 |
| Origin $(1 / 0)$ | -5.762 |
