Two management strategies for improving passenger transfer experience in train stations

Nicholas Molyneaux, Riccardo Scarinci, Michel Bierlaire

18th Swiss Transport Research Conference

May 18th 2018

Outline

- Introduction
- Gating as a control strategy
- 3 Flow seperators
- Simulation
- **5** Conclusion & next steps

Introduction

•0000000

0000000

Higher capacity & faster PT services, to serve higher demand.

Context

Introduction

0000000

Some of the services available at the Lausanne train station...

Motivation

- Lack of comfort, hazardous situations
- How to ensure a satisfactory level-of-service & safety?
 - Decrease pedestrian demand (not recommended!)
 - Spread the load over time & space
 - Influence pedestrian's routes
- Simulation is needed to address the complexity of the problem

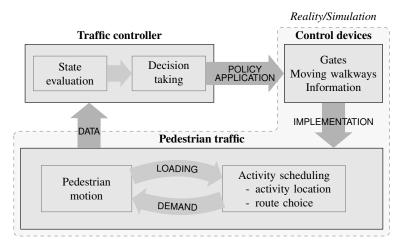

Goal: Design a framework to evaluate the impact of management strategies and to generate optimal control polices

00000000

00000000

What specific measures can be considered to impact dynamics:

- Adjustments to the PT schedule
- Control access to specific areas ⇒ gates
- Change link travel time ⇒ moving walkways
- Prevent counter flow ⇒ flow separators
- Attract pedestrians to specific locations

Existing strategies

Pedestrian management

- Little research on specific strategies.
- Some static measures (design) have be studied.

Traffic management

- Ramp metering
- Perimeter control
- Variable message signs
- Traffic lights

Introduction

00000000

Perimeter control - Keyvan-Ekbatani et al. (2012)

- Exploit the properties of the MFD
- Develop process equation for "total time spent" and "total traveled distance".
- Calibrate PI controller based on simulation data from a city.

We will follow the same approach, except for pedestrian traffic.

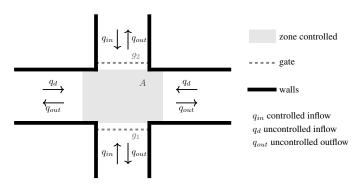

Gating as a control strategy

The level-of-service must be measured and controlled inside area A.

Process equation development

Conservation of pedestrians:

$$\frac{dN(t)}{dt} = q_{in}(t) + q_d(t) - q_{out}(t) \tag{1}$$

with:

- N is the number of people inside area A
- q_{in} controlled inflow
- q_d uncontrolled inflow
- qout outflow

Two hypotheses

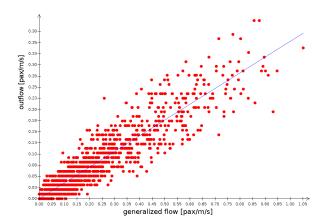

- 1. Hypothesis 1: A linear relation exists between outflow and generalized flow $(q_{out} = C_1 \cdot q_{e,gen})$.
- 2. Hypothesis 2: A pedestrian fundamental diagram exists.

Hypothesis 1

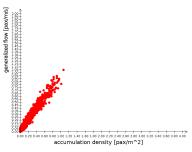

Introduction

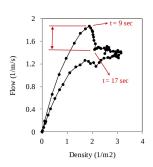

5 second intervals, based on tracking data in Lausanne

(a) Tracking data

(b) Saberi and Mahmassani (2014)

By exploiting both hypotheses and formulating the problem in terms of difference from steady state values, the process equation can be written as

$$\Delta \rho(k) = e^{-\frac{\Delta t \cdot F' \cdot C_1}{\omega_A}} \Delta \rho(k-1) + \frac{1}{F' \cdot C_1} (1 - e^{-\frac{\Delta t \cdot F' \cdot C_1}{\omega_A}}) \cdot [\Delta q_{in}(k-1) + \Delta q_d(k-1)]$$
(2)

From the process equation, a linear quadratic regulator is developed using standard methods of optimal control.

Flow seperators

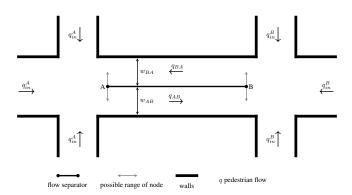

Figure: Schematic presentation of the devices used to separate the opposing flows. The inflow at each end determines the width available to each directed flow.

Width available for each direction is propotional to flows:

$$w_{AB} = egin{cases} w \cdot f_{min,AB}, & ext{if } rac{\sum q_{in,A}}{\sum q_{in,A} + \sum q_{in,B}} \leq f_{min,AB} \ w \cdot f_{max,AB}, & ext{if } rac{\sum q_{in,A}}{\sum q_{in,A} + \sum q_{in,B}} \geq f_{max,AB} \ w \cdot rac{\sum q_{in,A}}{\sum q_{in,A} + \sum q_{in,B}}, & ext{otherwise} \end{cases}$$

Simulation

Simulation setup

Introduction

The simulation is composed of:

- the operational model from the NOMAD package.
- a route choice computed thanks to a distance-based shortest path.

Evaluate the effectiveness by comparing the pedestrian's speed.

Conclusion & next steps

Conclusions

- Assumptions have been verified thanks to empirical data.
- Usage of optimal control simplifies calibration.
- Flow separators have potential to prevent counter flow.

Next steps

Introduction

Short term

- 1. Go back to sleep.
- 2. Run simulations and evaluate effectiveness.

Long term

- 1. Implement accelerated moving walkways
- 2. Model predictive control
- 3. Simulation based optimization

Gating as a control strategy
