CAMBRIDGE

Discrete Choice Methods with Simulation

Second Edition

This book describes the new generation of discrete choice methods, focusing on the many advances that are made possible by simulation. Researchers use these statistical methods to examine the choices that consumers, households, firms, and other agents make. Each of the major models is covered: logit, generalized extreme value (including nested and cross-nested logits), probit, and mixed logit, plus a variety of specifications that build on these basics. Simulation-assisted estimation procedures are investigated and compared, including maximum simulated likelihood, method of simulated moments, and method of simulated scores. Procedures for drawing from densities are described, including variance reduction techniques such as antithetics and Halton draws. Recent advances in Bayesian procedures are explored, including the use of the Metropolis–Hastings algorithm and its variant Gibbs sampling. This second edition adds chapters on endogeneity and expectation-maximization algorithms. No other book incorporates all these topics, which have arisen in the past 25 years. The procedures are applicable in many fields, including energy, transportation, environmental studies, health, labor, and marketing.

Professor Kenneth E. Train teaches econometrics, regulation, and industrial organization at the University of California, Berkeley. He also serves as Vice President of National Economic Research Associates (NERA), Inc., in San Francisco, California. The author of *Optimal Regulation: The Economic Theory of Natural Monopoly* (1991) and *Qualitative Choice Analysis* (1986), Dr. Train has written more than 60 articles on economic theory and regulation. He chaired the Center for Regulatory Policy at the University of California, Berkeley, from 1993 to 2000 and has testified as an expert witness in regulatory proceedings and court cases. He has received numerous awards for his teaching and research.

Additional Praise for the First Edition of *Discrete Choice Methods with Simulation*

“Ken Train’s book provides outstanding coverage of the most advanced elements of the estimation and usage of discrete choice models that require simulation to take account of randomness in the population under study. His writing is clear and understandable, providing both the new and experienced reader with excellent insights into and understanding of all aspects of these new and increasingly important methods.”

– Frank S. Koppelman, *Northwestern University*

“This is a masterful book, authored by one of the leading contributors to discrete choice methods and analysis. No other book covers this ground with such up-to-date detail in respect of theory and implementation. The chapters on simulation and recent developments such as mixed logit are most lucid. As a text or reference work this volume should have currency for a long time. It will appeal to the practitioner as much as to the specialist researcher who has been in this field for many years.”

– David Hensher, *The University of Sydney*

“Simulation-based estimation is a major advance in econometrics and discrete choice modeling. The technique has revolutionized both classical and Bayesian analysis. Ken Train’s many papers have made a large contribution to this literature. *Discrete Choice Methods with Simulation* collects these results in a comprehensive, up-to-date source, with chapters on behavioral foundations, theoretical and practical aspects of estimation, and a variety of applications. This book is a thoroughly enjoyable blend of theory, analysis, and case studies; it is a complete reference for developers and practitioners.”

– William Greene, *New York University*

Contents

1	Introduction	<i>page</i> 1
1.1	Motivation	1
1.2	Choice Probabilities and Integration	3
1.3	Outline of Book	7
1.4	A Couple of Notes	8
Part I Behavioral Models		
2	Properties of Discrete Choice Models	11
2.1	Overview	11
2.2	The Choice Set	11
2.3	Derivation of Choice Probabilities	14
2.4	Specific Models	17
2.5	Identification of Choice Models	19
2.6	Aggregation	29
2.7	Forecasting	32
2.8	Recalibration of Constants	33
3	Logit	34
3.1	Choice Probabilities	34
3.2	The Scale Parameter	40
3.3	Power and Limitations of Logit	42
3.4	Nonlinear Representative Utility	52
3.5	Consumer Surplus	55
3.6	Derivatives and Elasticities	57
3.7	Estimation	60
3.8	Goodness of Fit and Hypothesis Testing	67
3.9	Case Study: Forecasting for a New Transit System	71
3.10	Derivation of Logit Probabilities	74
4	GEV	76
4.1	Introduction	76
4.2	Nested Logit	77

4.3	Three-Level Nested Logit	86
4.4	Overlapping Nests	89
4.5	Heteroskedastic Logit	92
4.6	The GEV Family	93
5	Probit	97
5.1	Choice Probabilities	97
5.2	Identification	100
5.3	Taste Variation	106
5.4	Substitution Patterns and Failure of IIA	108
5.5	Panel Data	110
5.6	Simulation of the Choice Probabilities	114
6	Mixed Logit	134
6.1	Choice Probabilities	134
6.2	Random Coefficients	137
6.3	Error Components	139
6.4	Substitution Patterns	141
6.5	Approximation to Any Random Utility Model	141
6.6	Simulation	144
6.7	Panel Data	145
6.8	Case Study	147
7	Variations on a Theme	151
7.1	Introduction	151
7.2	Stated-Preference and Revealed-Preference Data	152
7.3	Ranked Data	156
7.4	Ordered Responses	159
7.5	Contingent Valuation	164
7.6	Mixed Models	166
7.7	Dynamic Optimization	169
Part II Estimation		
8	Numerical Maximization	185
8.1	Motivation	185
8.2	Notation	185
8.3	Algorithms	187
8.4	Convergence Criterion	198
8.5	Local versus Global Maximum	199
