### Motivation

#### Human dimension in

- engineering
- business
- marketing
- planning
- policy making

#### Need for

- behavioral theories
- quantitative methods
- operational mathematical models

< 回 > < 回 > < 回 >

### Motivation

#### Concept of demand

- marketing
- transportation
- energy
- finance

#### Concept of choice

- brand, product
- mode, destination
- type, usage
- buy/sell, product

- 4 目 ト - 4 日 ト - 4 日 ト

### In this course ...

#### Focus

- Individual behavior (vs. aggregate behavior)
- Theory of behavior which is
  - descriptive (how people behave) and not normative (how they should behave)
  - general: not too specific
  - operational: can be used in practice for forecasting
- Type of behavior: choice

### Applications

#### Mode choice in the Netherlands

- Context: car vs rail in Nijmegen
- Objective: sensitivity to travel time and cost, inertia.

#### Mode choice in Switzerland

- Context: Car Postal
- Objective: demand forecasting

# Applications

#### Swissmetro

- Context: new transportation technology
- Objective: demand pattern, pricing

#### Residential telephone services

- Context: flat rate vs. measured
- Objective: offer the most appropriate service

### Airline itinerary choice

- Context: questionnaire about itineraries across the US
- Objective: help airlines and aircraft manufacturer to design a better offer

### Importance

#### Daniel L. McFadden

- UC Berkeley 1963, MIT 1977, UC Berkeley 1991
- Laureate of The Bank of Sweden Prize in Economic Sciences in Memory of Alfred Nobel 2000
- Owns a farm and vineyard in Napa Valley
- "Farm work clears the mind, and the vineyard is a great place to prove theorems"

### Simple example

### Objectives

Introduce basic components of choice modeling:

- definition of the problem
- data
- model specification
- parameter estimation
- model application

### Application

Analysis of the market for smartphones

A B A A B A

### Choice problem

### Choice

Consumer's choice to

- own a smartphone
- own another ("non-smart") mobile phone.

### Questions

- what is the current market penetration of smartphones relative to non-smart phones?
- how will the penetration change in the future?

### Data

### Population

### adults

- in the US
- owning a mobile phone

#### Sample

- 2000 adults
- randomly selected

### Questions

# Is your mobile phone a smartphone

- Yes,
- No.

# What is your level of educational attainment?

- No high school diploma,
- High school graduate,
- College graduate.

#### Data

### Data

### Contingency table

Smartphone	Low $(k = 1)$	Medium $(k = 2)$	High $(k = 3)$	
Yes $(i = 1)$	75	500	510	1085
No $(i = 2)$	175	500	240	915
	250	1000	750	2000

#### Market penetration in the sample

- 1085/2000 = 54.3%
- How do we predict? We need a model.

< 回 > < 三 > < 三 >

### Model specification

### Variables

### Dependent

- or endogenous
- what is explained
- here: choice to use a smartphone
- notation: i
- nature: discrete

### Independent

- or exogenous
- explanatory
- here: level of education
- notation: k
- nature: discrete
- 1 = "low"; 2= "medium"; 3="high"

### Probabilities

### Marginal probability

- frequency of smartphone ownership in the population
- *P*(*i* = 1)
- Inference: use the sample to obtain an estimate
- $P(i=1) \approx \widehat{P}(i=1) = 1085/2000 = 0.543$

### Joint probability

• frequency of smartphone ownership and medium level of education

• 
$$P(i = 1, k = 2) \approx \widehat{P}(i = 1, k = 2) = 500/2000 = 0.25$$

### Conditional probability

• frequency of smartphone ownership in the population of people with medium level of education

• 
$$P(i=1|k=2) \approx \widehat{P}(i=1|k=2) = 500/1000 = 0.50$$

### Model

$$P(i,k) = P(i|k)P(k)$$
  
=  $P(k|i)P(i)$ 

### Interpretation

- *P*(*i*|*k*): level of education explains smartphone ownership
- P(k|i): smartphone ownership explains level of education

#### Model

- identify stable causal relationships between the variable
- here: we select P(i|k) as an acceptable behavioral model
- stability over time necessary to forecast

#### Model

### Model

### Specification

$$\begin{array}{rcl} P(i=1|k=1) & = & \pi_1, \\ P(i=1|k=2) & = & \pi_2, \\ P(i=1|k=3) & = & \pi_3. \end{array}$$

#### Parameters

- π1, π2, π3
- unknown
- must be estimated from data

æ

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

### Model estimation

$$\pi_j = P(i=1|k=j) \approx \widehat{\pi}_j = \widehat{P}(i=1|k=j) = \frac{\widehat{P}(i=1,k=j)}{\widehat{P}(k=j)}$$

Using the contingency table:

$$\widehat{\pi}_1 = 75/250 = 0.300,$$
  
 $\widehat{\pi}_2 = 500/1000 = 0.500,$   
 $\widehat{\pi}_3 = 510/750 = 0.680.$

イロン イヨン イヨン イヨン

# Quality of the estimates

#### Informal checks

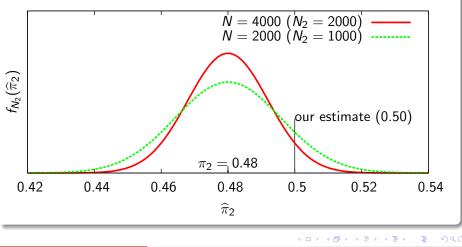

- Do these estimates make sense?
- Do they match our a priori expectations?
- Here: as years of education increases, there is a higher penetration of smartphones.

### Quality of the estimates

- How is  $\hat{\pi}_j$  different from  $\pi_j$ ?
- We have no access to π<sub>j</sub>
- For each sample, we would obtain a different value of  $\widehat{\pi}_j$
- $\hat{\pi}_j$  is distributed.

### Quality of the estimates

Distribution of  $\pi_2$ 

# Quality of the estimates

### Distribution of $\pi_2$

- Smaller samples are associated with wider spread
- The larger the sample, the better the estimate
- In practice, impossible to repeat the sampling multiple times
- Distributions derived from theoretical results or simulation

### Properties

- Bernoulli (0/1) random variables
- Variance:  $\sigma_j^2 = \pi_j (1 \pi_j)$
- Sample average: unbiased estimator
- Standard error of the estimator:  $\sqrt{\sigma^2/N}$
- Estimated standard error:

$$\widehat{s}_{\pi_j} = \sqrt{\widehat{\pi}_j (1 - \widehat{\pi}_j)/N_j}$$

#### Testing

### Testing

#### Estimates and standard errors

parameter	$\widehat{\pi}_{j}$	$\widehat{s}_{\pi_i}$	
$\pi_1$	0.300	0.029	
$\pi_2$	0.500	0.016	
$\pi_3$	0.300 0.500 0.680	0.017	

3

・ロト ・ 日 ト ・ ヨ ト ・ ヨ ト

### Maximum likelihood estimation

#### Likelihood function

$$\mathcal{L}^* = \prod_{n=1}^N P(i_n | k_n)$$

- Probability that our model reproduces exactly the observations
- For our example:

$$\mathcal{L}^* = (\pi_1)^{75} (1 - \pi_1)^{175} (\pi_2)^{500} (1 - \pi_2)^{500} (\pi_3)^{510} (1 - \pi_3)^{240}$$

< 回 > < 三 > < 三 >

### Maximum likelihood estimation

#### Estimates

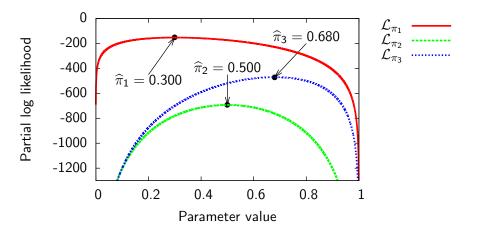

- Values of the parameters that maximize  $\mathcal{L}^*$ .
- In practice, the logarithm is maximized

$$\mathcal{L} = \ln \mathcal{L}^* = \sum_{n=1}^N \ln P(i_n | k_n).$$

#### Properties

- Consistency
- Asymptotic efficiency

### Maximum likelihood

æ

→

▲ 伺 ▶ ▲ 三 ▶

#### Hypothesis testing

# Hypothesis testing

### Null hypothesis

- Default hypothesis
- Is accepted except if the data tells otherwise
- Example: education has no effect on smartphone ownership
- Under the null hypothesis, we have a restricted model

$$\pi = \pi_1 = \pi_2 = \pi_3.$$

• We compare the unrestricted and the restricted model

### Hypothesis testing

#### Unrestricted model

• Log likelihood function:

 $\begin{aligned} \mathcal{L} = 75 \ln(\pi_1) + 175 \ln(1 - \pi_1) + 500 \ln(\pi_2) + 500 \ln(1 - \pi_2) \\ + 510 \ln(\pi_3) + 240 \ln(1 - \pi_3) \end{aligned}$ 

- Estimates:  $\hat{\pi}_1 = 0.300$ ,  $\hat{\pi}_2 = 0.500$ ,  $\hat{\pi}_3 = 0.680$ .
- Maximum likelihood: -1316.0

### Restricted model

• Log likelihood function:

$$\mathcal{L} = 1085 \ln(\pi) + 915 \ln(1-\pi).$$

- Estimate:  $\hat{\pi} = 0.543$
- Maximum likelihood: -1379.1

# Hypothesis testing

Property

- If the null hypothesis is true
- the statistic

$$-2(\mathcal{L}^{R}-\mathcal{L}^{U}) = -2(-1379.0+1316.0) = 126.1$$

• is asymptotically distributed as  $\chi^2$  with degrees of freedom equal to the number of restrictions (2 here).

### Applying the test

- the critical value of the  $\chi^2$  distribution with 2 degrees of freedom at 99% significance is 9.210 < 126.1.
- The null hypothesis is rejected with at least 99% confidence.
- Education *does* influence smartphone ownership.

#### Application

# Model application

#### Present scenario

- Level of education: low (12.5%), medium (50%), high (37.5%)
- Penetration rate:  $0.300 \times 12.5\% + 0.500 \times 50\% + 0.680 \times 37.5\% = 54.3\%$

### Future scenario

- Level of education will change in the future
- Level of education: low (10%), medium (40%), high (50%)
- Penetration rate:  $0.300 \times 10\% + 0.500 \times 40\% + 0.680 \times 50\% = 57\%$

#### Note

- Causal relationship does not vary over time
- Values of the explanatory variables evolve over time
