# Comparing different rebalancing operations strategies in car sharing systems: A generic optimization framework

Selin Ataç Nikola Obrenović, Michel Bierlaire

Transport and Mobility Laboratory School of Architecture, Civil and Environmental Engineering École Polytechnique Fédérale de Lausanne

September 07, 2022

## Outline

- 1. Introduction
- 2. Evaluating different rebalancing operation strategies
  - Motivation
  - Literature
- 3. Methodology
  - Considered system and the framework
  - Preliminary experiments
  - Rebalancing operations optimization
- 4. Conclusion

#### Introduction

- 37.5% of the U.S. greenhouse gas emissions is due to transportation (EPA, 2021<sup>1</sup>).
  - Passenger cars contribute the most with 40.5%.

<sup>&</sup>lt;sup>1</sup>EPA (2021) Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2019.

<sup>&</sup>lt;sup>2</sup>Amatuni, L., Ottelin J., Steubing B. and Mogollón J. M. (2020) Does car sharing reduce greenhouse gas emissions? Assessing the modal shift and lifetime shift rebound effects from a life cycle perspective, Journal of Cleaner Production.

#### Introduction

- 37.5% of the U.S. greenhouse gas emissions is due to transportation (EPA, 2021<sup>1</sup>).
  - Passenger cars contribute the most with 40.5%.
- Car sharing systems
  - Short rentals
  - Higher car and less parking utilization
  - Examples: Mobility, car2go, SHARENOW

- Is shared mobility as sustainable as we think?
  - Reck et al. (2022)<sup>3</sup> claim that personalized micro-mobility is more sustainable than the shared one.
  - One reason is costly rebalancing operations.

<sup>&</sup>lt;sup>3</sup>Daniel J. Reck, Henry Martin, and Kay W. Axhausen. Mode choice, substitution patterns and environmental impacts of shared and personal micro-mobility. Transportation Research Part D: Transport and Environment. 102:103134, 2022.

- Is shared mobility as sustainable as we think?
  - Reck et al. (2022)<sup>3</sup> claim that personalized micro-mobility is more sustainable than the shared one.
  - One reason is costly rebalancing operations.
- The added-value of bike rebalancing in bike sharing systems?
  - Shu et al. (2013)<sup>4</sup> find that the number of substituted trips change as a function of number of bicycles and number of redistributions per day.
  - Periodic and frequent rebalancing operations are not necessary for some configurations of the system.

- Sioux Falls, US scenario
  - 84110 agents
  - 24 stations (5 vehicles and 5 free parking spots per station)

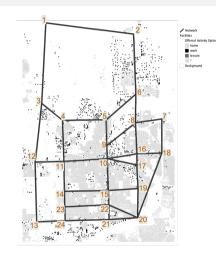

- Sioux Falls, US scenario
  - 84110 agents
  - 24 stations (5 vehicles and 5 free parking spots per station)
- The available transport modes are car, public transport, bike, walk, and one-way car sharing.

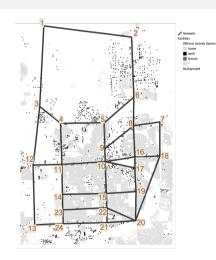

- Sioux Falls. US scenario
  - 84110 agents
  - 24 stations (5 vehicles and 5 free parking spots per station)
- The available transport modes are car, public transport, bike, walk, and one-way car sharing.
- Only one CSS operator is available.

- Sioux Falls, US scenario
  - 84110 agents
  - 24 stations (5 vehicles and 5 free parking spots per station)
- The available transport modes are car, public transport, bike, walk, and one-way car sharing.
- Only one CSS operator is available.
- Every agent has a membership.

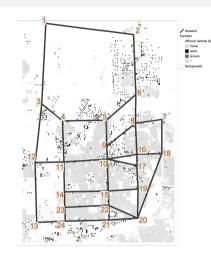

- Sioux Falls, US scenario
  - 84110 agents
  - 24 stations (5 vehicles and 5 free parking spots per station)
- The available transport modes are car, public transport, bike, walk, and one-way car sharing.
- Only one CSS operator is available.
- Every agent has a membership.
- Parameters are set to default.

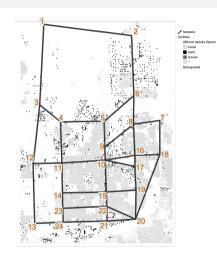

### Scenarios

- "do nothing" scenario
  - The final configuration of the vehicles for one iteration is fed back to MATSim as an initial configuration for the next iteration.

#### Scenarios

- "do nothing" scenario
  - The final configuration of the vehicles for one iteration is fed back to MATSim as an initial configuration for the next iteration.
- "rebalance" scenario
  - The minimum required number of vehicles per station is computed and the free parking is determined where each station has 10 total parking spots.

## Results

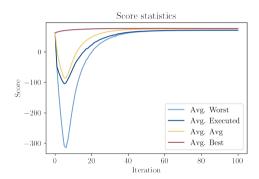

Figure: Score statistics (rebalance)

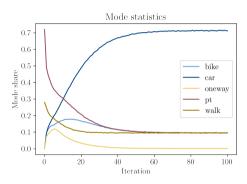

Figure: Mode statistics (rebalance)

# Comparison of two rebalancing strategies

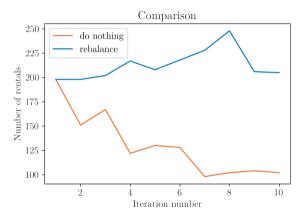

Figure: Number of rentals for the two rebalancing strategies

# What happens if we plug in an optimization model?

#### Three strategies:

- Models proposed in Gambella et al. (2018)<sup>7</sup> and Zhao et al. (2018)<sup>8</sup>.
  - Gambella et al. (2018): maximize system profit with fixed numbers of vehicles and staff and limited station capacity.
  - Zhao et al. (2018): determine the optimal numbers of vehicles and staff to serve all demand while minimizing costs, with unlimited capacity at all stations.
- A third strategy based on these two models.
  - Derived from the first strategy by considering a priority trip list and forcing the model to serve them.

An integrated framework for electric vehicle rebalancing and staff relocation in one-way carsharing systems: Model formulatio and lagrangian relaxation-based solution approach. Transportation Research Part B: Methodological, 117:542-572, 2018.

# What happens if we plug in an optimization model?

- A case study from Turin, Italy.
  - 10 stations
  - 10-70 number of vehicles
  - 0-3 staff
  - 418 trips/day on average
  - 96 timesteps (15 mins intervals)
  - Each instance is solved by CPLEX 22.10 on a server with Xeon(R) Gold 6140 CPU clocked at 2.30GHz and 36 processors with a time limit of 72 hours.

# What happens if we plug in an optimization model?

  - 418 trips/day on average
  - 96 timesteps (15 mins intervals)
  - Each instance is solved by CPLEX 22.10 on a server with Xeon(R) Gold 6140 CPU clocked at 2.30GHz and 36 processors with a time limit of 72 hours.
- ... but
  - The scale of the problem is not realistic and we can only solve it in three days!
  - Splitting the time horizon into time windows helps in terms of computational time but sacrifices from solution quality.

### Conclusions and future work

- A generic framework to evaluate different rebalancing operations strategies is presented.
- Preliminary experiments on Sioux Falls scenario using MATSim carsharing API show promising results for naive heuristics.

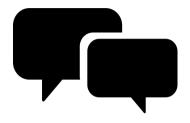

## Conclusions and future work

- A generic framework to evaluate different rebalancing operations strategies is presented.
- Preliminary experiments on Sioux Falls scenario using MATSim carsharing API show promising results for naive heuristics.
- The next steps include
  - selecting a choice model and rebalancing operations strategies from the literature,
  - analyzing the effect of rebalancing operations that consider different strategies, and
  - applying to a bigger case study, such as Zurich, Switzerland.
